

DROSJER QUANTUM

Fleet Risk Report — Orbital Risk Index

Drosjer Quantum continuously scores orbital risk for satellite fleets from public tracking data, breaking every score into six transparent factors with a confidence level you can see.

Continuous orbital risk scoring. Six transparent factors. Confidence on every score. Calibration against historical events in progress.

Scores below are computed from public CelesTrak / Space-Track data on a demonstration sample of public objects. No customer fleet is shown.

Risk grades are conditions-dependent: they rise during geomagnetic activity and busier conjunction periods, and the engine re-scores continuously as conditions change. A grade is a live reading of current conditions, not a fixed label — the responsiveness is the point.

Generated: 2026-06-03T23:16:07.702899+00:00 **Model version:** h-1.0 **Objects:** 18 scored / 18 requested

Sample fleet report rendered for demonstration. The objects and scores shown are illustrative of the report format.

Calibration status: factor weights and grade bands are STARTING values (model h-1.0), not yet calibrated against historical events; calibration is in progress. Scores are an explainable heuristic, not a forecast.

Fleet risk summary

Grade distribution across the 18 scored object(s). Higher risk = worse grade (A = lowest risk).

Objects by risk (highest first)

** Muted grade = reduced confidence: derived from the surviving (non-degraded) factors; read it together with the confidence value, not as a standalone verdict.*

Methodology

Six factors compose the risk score; higher normalized values mean more risk. A degraded factor (stale or missing input) is dropped and the surviving weights renormalize — its neutral prior is never folded into the mean. Confidence is a separate axis from the risk grade.

Factors & weights

orbital_regime 0.15 · conjunction_frequency 0.25 · space_weather 0.10 · component_age 0.15 ·
operator_track_record 0.15 · element_set_quality 0.20

Grade bands (composite $\geq$ threshold $\rightarrow$ grade; higher = worse)

$F \geq 0.85 \cdot D \geq 0.70 \cdot C \geq 0.55 \cdot B \geq 0.40 \cdot A \geq 0.00$

Model version

h-1.0 (printed for reproducibility — a stored score is recomputable against this version's frozen weights and bands)

Calibration

Calibration status: factor weights and grade bands are STARTING values (model h-1.0), not yet calibrated against historical events; calibration is in progress. Scores are an explainable heuristic, not a forecast.
